Epidemic

The American opioid addiction crisis is spiraling out of control. After crack downs by the government on prescription medication, opioid users are turning to the streets and drug dealers to fill the role. Prescription grade pain killers are hard to find so users switched to heroin and fentanyl.

Fentanyl is 10 times stronger than heroin. Three milligrams is enough to kill an average-sized adult male.

As the number of fentanyl overdoses increase, so do the number of pill labs, creating a nightmare situation for first responders and decontamination contractors. The deadly drug when (airborne or on surfaces) can come in contact with unprotected skin and cause serious illness or death.

Lab Tested

Apple Environmental began testing their Meth Remover product for efficacy in fentanyl decontamination with significant results. Testing was completed at ALS Environmental Laboratory with all results showing Non-Detection levels. "I am quite confident that Meth Remover, properly applied, would be very effective in the destruction and removal of fentanyl residues." quoted W. Wesley Parish Ph.D Chemist

Field Application

Shane Woodworth of Crime Scene Cleaners completed one of our field applications in which the lab results are listed to the left. Shane started decontamination in the basement (where the pill lab was found) with Apple Environmental Meth Remover. Areas upstairs believed to be uncontaminated were cleaned with only HEPA vacuuming and another cleaning solution. The basement passed with Non-detection after the first round of decontamination. He stated that, "You'll notice that there were still some hits in the upper level after cleaning alone. The second round of clearance sampling shows no detection. This was after addressing the problem areas with your cleaning solution (Apple Environmental Meth Remover)."
